PROFILE

Senior Frontend Engineer with 6+ years building web applications including dashboards, internal tools, and the component libraries that power them. Specializes in React and TypeScript. Recent work includes dashboard software used by 700+ employees across multiple environments, a matching-system feature for a real-estate deal platform, component libraries, and shared npm packages supporting internal applications. Experience with Figma design systems, real-time data via WebSockets, and modern state management. Works directly with stakeholders and backend teams to deliver scalable frontend solutions.

PROFESSIONAL EXPERIENCE

Senior Engineer

03/2026 – 08/2026

Clever Real Estate

Remote

- Re-architected the core form on the company's deal management platform onto TanStack Form, consolidating three separate, drifting sources of form state (a Redux edit-mirror, a hand-rolled save thunk, a god context) into one, turning routine field changes from a multi-system coordination problem into a single, local edit
- Moved the platform off a long-lived staging branch onto trunk-based deploys, migrating CI/CD off a Vercel PAT setup onto GitHub's native integration with required-check gating, enabling QA to validate against branch based preview deployments
- Integrated agentic AI (mostly Claude) into daily workflows to learn Python/Django while building the backend for a new event-sourced agent-matching queue system

Senior Frontend Engineer

01/2026 – 03/2026

CompoSecure

Somerset, NJ

- Architected a TypeScript monorepo using Turborepo, packaging shared auth, validation, and client utilities adopted across all internal manufacturing apps
- Designed a Zod schema library with 80+ schemas for production data, giving the frontend full type safety from API response to render
- Built data pipelines that take raw API responses through validation and transformation layers, catching bad data before it hits components
- Implemented a shared auth layer with encrypted token storage and Zustand, cutting redundant refresh calls and standardizing patterns across apps
- Created material verification schemas as a finite state machine with full Vitest coverage on transitions and SignalR event handling
- Built transaction aggregation that normalizes nested API data into indexed structures for fast lookups and cleaner rendering logic
- Built a React and Vite playground for testing packages in isolation: mock data generation, state machine simulation, and auth flow testing

Frontend Engineer

04/2023 – 01/2026

CompoSecure

Somerset, NJ

- Built a React and TypeScript dashboard application for production floor labor tracking and employee management, used daily by 700+ manufacturing employees across 80+ kiosk and desktop stations

- Designed the UI for 40+ touchscreen kiosks using React Aria Components and Tailwind CSS, prioritizing touch targets and accessibility for factory floor conditions
- Created a design system in Figma and shipped it as a React component library to npm with Storybook documentation and Chromatic visual testing
- Implemented live transaction updates over SignalR with reconnection logic so job status stays current across all floor stations
- Set up frontend state with Jotai and TanStack Query to handle optimistic updates and caching across high-traffic kiosk sessions
- Built transaction forms using react-hook-form and Zod validation to prevent user errors that directly impact inventory counts and labor cost reporting

Web Developer/Special Projects Manager

Rutgers University

05/2019 – 04/2023
New Brunswick, NJ

- Built a responsive inventory management and ticketing dashboard with cross-browser and mobile support
- Created product mockups in Visio and Adobe Creative Suite to communicate technical requirements and secure stakeholder buy-in
- Mentored student workers on troubleshooting complex technical issues

EDUCATION

Master of Information

Rutgers University
